Ch 5 1 ModelSelect

Analyze the ISLR (Introduction to Statistical Learning with R) data package's baseball 'Hitters' data frame:

```

There are missing values, before we proceed we will remove them:

```
with(Hitters, sum(is.na(Salary)))
```

```
## [1] 59
```

```
Hitters=na.omit(Hitters)
with(Hitters, sum(is.na(Salary)))
```

```
## [1] 0
```

Best Subset regression

We will now use the package `leaps` to evaluate all the best-subset models.

```
library(leaps)
regfit.full = regsubsets(Salary~., data=Hitters)
summary(regfit.full)
```

```

By default, it gives the first 8 variables best-subset models. Let's do it again for all the variables:

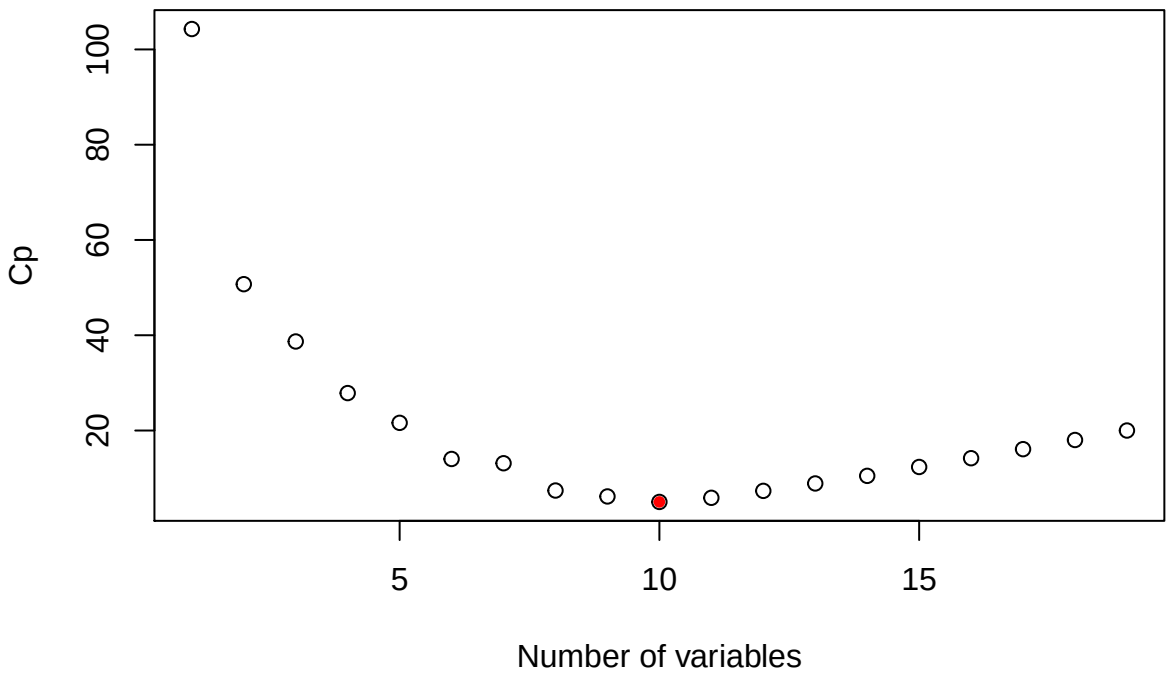
```
regfit.full = regsubsets(Salary~., data=Hitters, nvmax=19)
reg.summary = summary(regfit.full)
names(reg.summary)
```

```
## [1] "which"  "rsq"    "rss"    "adjr2"  "cp"     "bic"    "outmat" "obj"
```

```
plot(reg.summary$cp, xlab="Number of variables", ylab="Cp")
which.min(reg.summary$cp)
```

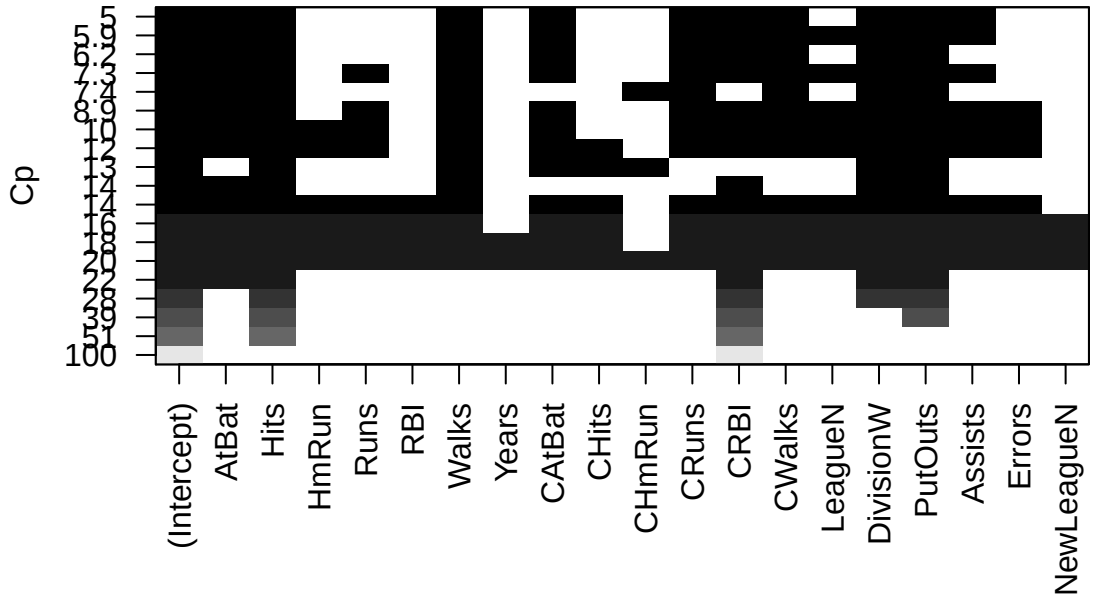
```
## [1] 10
```

```
points(10, reg.summary$cp[10], pch=20, col="red")
```



There is a method for the `regsubset` object:

```
plot(regfit.full,scale="Cp")
```



```
coef(regfit.full, 10)
```

```
