##
##           NA's           :59
```

There are missing values, before we proceed we will remove them:

```
with(Hitters, sum(is.na(Salary)))
```

```
## [1] 59
```

```
Hitters=na.omit(Hitters)
with(Hitters, sum(is.na(Salary)))
```

```
## [1] 0
```

## Best Subset regression

We will now use the package `leaps` to evaluate all the best-subset models.

```
library(leaps)
regfit.full = regsubsets(Salary~., data=Hitters)
summary(regfit.full)
```

```
## Subset selection object
## Call: regsubsets.formula(Salary ~ ., data = Hitters)
## 19 Variables (and intercept)
##           Forced in Forced out
## AtBat      FALSE      FALSE

## 2 ( 1 ) "*" " " " " " " " " " " " " " "
## 3 ( 1 ) "*" " " " " " " "*" " " " " " "
## 4 ( 1 ) "*" " " " " "*" "*" " " " " " "
```

```
## 5 ( 1 ) "*" " " " " "*" "*" " " " " " "
## 6 ( 1 ) "*" " " " " "*" "*" " " " " " "
## 7 ( 1 ) " " " " " " "*" "*" " " " " " "
## 8 ( 1 ) " " "*" " " "*" "*" " " " " " "
```

By default, it gives the first 8 variables best-subset models. Let's do it again for all the variables:

```
regfit.full = regsubsets(Salary~., data=Hitters, nvmax=19)
reg.summary = summary(regfit.full)
names(reg.summary)
```

```
## [1] "which" "rsq" "rss" "adjr2" "cp" "bic" "outmat" "obj"
```

```
plot(reg.summary$cp, xlab="Number of variables", ylab="Cp")
which.min(reg.summary$cp)
```

```
## [1] 10
```

```
points(10, reg.summary$cp[10], pch=20, col="red")
```

There is a method for the `regsubset` object:

```
plot(regfit.full, scale="Cp")
```

```
coef(regfit.full, 10)
```

```
